

1 ABSTRACT

2 A system and method for treatment of neurological disorders with sound therapy
3 is disclosed. The system can have a local PDA, a remote server, a physician's PC, and a
4 database connected to the server. The PDA and PC can be networked with the server.
5 The PC can initialize a treatment protocol stored at the server. The server can utilize the
6 database and the protocol from the PC to come up with a recommended therapy. The
7 recommended therapy can be selected by the PC and sent to the PDA. The PDA can then
8 execute the selected therapy on the patient. The PDA can also record biometric and other
9 feedback and send it to the server.
